

Congratulations on cracking the first system. The second combination has been encrypted using XOR and the keystream of the LFSR with characteristic polynomial $p(x) = x^4 + x^1 + 1$ and initial state 1001. The encrypted combination is:

0111, 0011, 1101

where the decimal number/binary combinations are given in the table below. You only need to find 12 digits of the keystream in order to decrypt. Make sure to show your work on the original quiz!!!

Decimal	Binary Number
---------	---------------

0	0000
---	------

1	0001
---	------

2	0010
---	------

3	0011
---	------

4	0100
---	------

5	0101
---	------

6	0110
---	------

7	0111
---	------

8	1000
---	------

9	1001
---	------
